

ELIXIR REPERTOIRE NOW AVAILABLE ON THE SOLARIS 10 OPERATING SYSTEM ON ULTRASPARC AND AMD OPTERON PROCESSOR-BASED SUN FIRE SERVERS

Elixir Technology Brings Accelerated Enterprise Reporting, ETL, and Information Dashboard to Sun Customers on the Solaris 10 OS on SPARC and x64 platforms

SINGAPORE – December 1, 2006 – Elixir Technology, a leading provider of integrated business intelligence (BI) solutions, today announced the general availability of Elixir Repertoire for the Solaris™ 10 operating system (OS) on UltraSPARC™ and AMD Opteron processor-based Sun Fire™ servers. Elixir's support for the Solaris 10 OS on UltraSPARC and AMD Opteron processor-based systems gives Elixir customers accelerated enterprise reporting and business intelligence (BI) performance on the latest release of Sun's operating system.

"We're pleased that Elixir Technology has chosen to ensure its products are available on the Solaris 10 operating system and Sun Fire servers," said Juan Carlos Soto, Vice President of Market Development, Sun Microsystems. "Using the Solaris 10 OS on both UltraSPARC and x64 (x8632 and 64-bit) platforms enables Elixir to provide users of Elixir Repertoire with enhanced performance, scalability and cost efficiency, ultimately allowing customers to better achieve their business objectives."

Elixir Repertoire is an integrated BI suite, designed for enabling intelligent enterprises to compete effectively in a fast-moving globalized market. Addressing the end-to-end information life cycle, one can activate the entire suite or the individual products as required to aggregate and transform, present and deliver, navigate and visualize, monitor and activate enterprise data. Layered upon the same underlying cross-platform architecture for security, repository, and open integration APIs, the products include:

- 1) Elixir Ensemble: Data Aggregation and Extraction-Transformation-Loading (ETL) with OLAP Cube and Data Cleansing.
- 2) Elixir Report: Enterprise Reporting and Information Delivery for Web, Print and Mobile.
- 3) Elixir Perspective: Information Dashboard for Data Analysis and Scorecard Navigation for Performance Measurement.
- 4) Elixir Choreographer: Data Activation and Process Integration for Performance Monitoring.

With the Solaris 10 OS, Elixir customers have access to the popular features that are unique to this operating system, such as Dynamic Tracing (DTrace), Predictive Self-Healing, Solaris Containers and Solaris ZFS. These advanced features provide Elixir customers with increased network security, optimal performance and less overall server downtime.

"World-class organizations demand a high level of performance, which is why many of our prospects are Sun Solaris customers," said Shih-Hor Lau, Elixir Technology CEO. "We are excited to be working closely with Sun to further accelerate our BI suite for high performance business intelligence environments."

About Elixir Technology Pte Ltd

Elixir Technology provides a Unified Business Intelligence Platform for end-to-end information life cycle coverage from Extraction-Transformation-Loading (ETL), Data Aggregation, Cube, Reporting, Dashboard and Activation. Our flagship product, Elixir Report, has garnered over 600 worldwide customers across 50 countries in various vertical industries such as government, financial services, telecommunications, healthcare, retail, and technology. Going beyond enterprise reporting needs, our Integrated Business Intelligence Suite, Elixir Repertoire, is designed to further empower our customers toward becoming intelligent enterprises, where critical information is readily available to drive decisions and actions. Elixir Technology is headquartered in Singapore, with an R&D arm in UK. Through a network of partners, Elixir's products are represented in many parts of the world across major continents including Asia, America, and Europe.
