

Business Intelligence Platform for MySQL

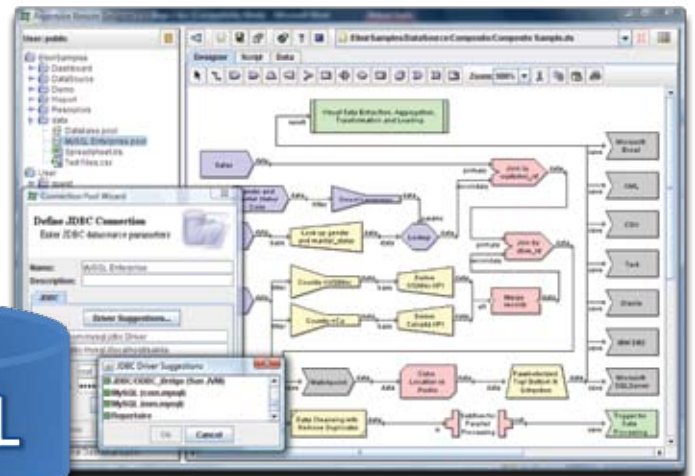

Providing Out-of-Box Integrated Business Intelligence

Combining MySQL with Elixir Repertoire for Best Price Performance

Elixir provides a full-featured, integrated Business Intelligence platform certified for MySQL. Instead of having to cobble together disparate pieces of BI components, open source or otherwise, Elixir Repertoire is the one single BI platform that can be installed, configured and deployed in minutes, with its full functionality readily available as REST-based Web Services.

Certified for MySQL Enterprise Edition, Elixir Repertoire supports MySQL both as a data source and a data storage target, with enterprise level support for corporate deployment. One can use Java, PHP or newer environments like Ruby and Groovy to access and incorporate BI functionality for Reporting, Dashboard, Data ETL and Scheduling into any web-based or standalone applications, mobile or desktop gadgets.

With its rich functionality, ease of use and cost-effective server-side licensing, Elixir Repertoire is the price performance BI platform of choice for MySQL, whether it is an in-house BI application development to improve business efficiency or an Independent Software Vendor looking to embed BI functionality in its product for increased competitiveness.

Extract, Transform, and Load to and from MySQL and other Data Sources

System Requirements:

- Java SE 5.0 or later
- 256MB RAM for Designer, 512MB for Server recommended
